# Modal Logic

---

**In classical logic, it is only important whether a formula is true**

**In modal logic, it is also important in which**

- **way**
- **mode**
- **state**

**a formula is true**

# Modal Logic

---

In classical logic, it is only important whether a formula is true

In modal logic, it is also important in which

- way
- mode
- state

a formula is true

A formula (a proposition) is

- necessarily / possibly true
- true today / tomorrow
- believed / known
- true before / after an action / the execution of a program

# Propositional Modal Logic: Formulas

---

- The propositional variables  $p \in \text{Var}$  are modal formulas
- If  $A, B$  are modal formulas, then

$\neg A$      $(A \wedge B)$      $(A \vee B)$      $(A \rightarrow B)$      $(A \leftrightarrow B)$

$\Box A$     (read “box  $A$ ”, “necessarily  $A$ ”)

$\Diamond A$     (read “diamond  $A$ ”, “possibly  $A$ ”)

are modal formulas

# Informal Interpretations of $\Box$

---

$\Box F$  means

- $F$  is necessarily true
- $F$  is always true (in future states/words)
- an agent  $a$  believes  $F$
- an agent  $a$  knows  $F$
- $F$  is true after all possible executions of a program  $p$

# Informal Interpretations of $\square$

---

$\square F$  means

- $F$  is necessarily true
- $F$  is always true (in future states/words)
- an agent  $a$  believes  $F$
- an agent  $a$  knows  $F$
- $F$  is true after all possible executions of a program  $p$

Notation

If necessary write

$$\square_a F \quad \square_p F \quad [a]F \quad [p]F$$

instead of  $\square F$

# Informal Interpretations of $\diamond$

---

|   |   |
|---|---|
| $\Box F$  | $\diamond F$ (the same as $\neg \Box \neg F$ )  |
| <b><math>F</math> is necessarily true</b>   | <b><math>F</math> is possibly true</b>  |
| <b><math>F</math> is always true</b>  | <b><math>F</math> at least once true</b>  |
| <b>agent <math>a</math> believes <math>F</math></b>                                   | <b><math>F</math> is consistent with <math>a</math>'s beliefs</b>                             |
| <b>agent <math>a</math> knows <math>F</math></b>                                      | <b><math>a</math> does not know <math>\neg F</math></b>                                       |
| <b><math>F</math> is true after all possible executions of program <math>p</math></b> | <b><math>F</math> is true after at least one possible execution of program <math>p</math></b> |

# Kripke Structures

---

Given: a propositional signature  $\text{Var}$

## Definition

A Kripke structure

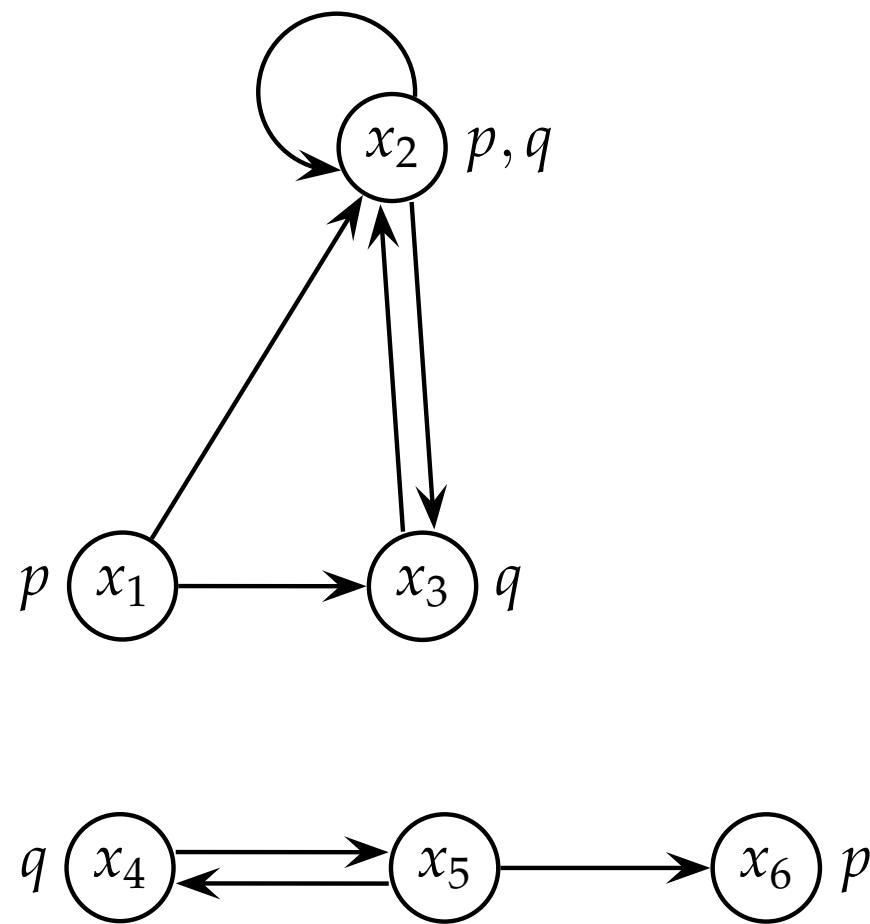

$$\mathcal{K} = (S, R, I)$$

consists of

- a non-empty set  $S$  (of worlds / states)
- an *accessibility relation*  $R \subseteq S \times S$
- an *interpretation*  $I : \text{Var} \times S \rightarrow \{\underline{\text{true}}, \underline{\text{false}}\}$

# Kripke Structures: Example

set of states

Interpretation I

# Modal Logic: Semantics

---

Given: Kripke structure  $\mathcal{K} = (S, R, I)$

## Valuation

$$val_{\mathcal{K}}(p)(s) = I(p)(s) \quad \text{for } p \in \mathbf{Var}$$

$val_{\mathcal{K}}$  defined for propositional operators in the same way as  $val_I$

$$val_{\mathcal{K}}(\Box A)(s) = \begin{cases} \underline{\text{true}} & \text{if } val_{\mathcal{K}}(A)(s') = \underline{\text{true}} \text{ for} \\ & \text{all } s' \in S \text{ with } sRs' \\ \underline{\text{false}} & \text{otherwise} \end{cases}$$

$$val_{\mathcal{K}}(\Diamond A)(s) = \begin{cases} \underline{\text{true}} & \text{if } val_{\mathcal{K}}(A)(s') = \underline{\text{true}} \text{ for} \\ & \text{at least one } s' \in S \text{ with } sRs' \\ \underline{\text{false}} & \text{otherwise} \end{cases}$$
